

## CLAIMS

What is claimed is:

A computer-implemented method of structural content filtration to reduce the number of hypotheses for the location of an active object in a recorded image generated by a graphical user interface (GUI) of an application program comprising:

5 transforming the recorded image and a corresponding playback image;  
determining a sub-image from the transformed recorded image which corresponds to an object to be searched for in the transformed playback image;  
determining a set of points on the transformed playback image which have  
10 appropriate values for matching the sub-image; and  
filtering hypotheses on the playback image which are more than a selected distance from any one of the subset of points.

2. The method of claim 1, wherein transforming the recorded image and the corresponding playback image comprises changing color values of pixels in the images  
15 into at least one of black and white pixels.

3. The method of claim 1, wherein the object comprises a non-textual object.

4. The method of claim 1, wherein the filtered hypotheses are incorrect hypotheses for the active object.

5. The method of claim 1, wherein a hypothesis comprises a contour of an object  
20 on the playback image which corresponds to a contour of an object on the recorded image.

6. The method of claim 1, wherein filtering hypotheses comprises rejecting a hypothesis if the contour of the hypothesis does not have an intersection with any rectangle having a top left corner at a point of the subset of points and a predetermined  
25 width and height.

7. The method of claim 1, wherein filtering hypotheses comprises rejecting a hypothesis if the distance between one of points in the subset of points and a contour of the hypothesis is greater than a predetermined distance.

8. An article comprising: a machine accessible medium containing instructions,  
30 which when executed, result in structural content filtration to reduce the number of hypotheses for the location of an active object in a recorded image generated by a graphical user interface (GUI) of an application program by

transforming the recorded image and a corresponding playback image;  
determining a sub-image from the transformed recorded image which corresponds  
to an object to be searched for in the transformed playback image;  
determining a set of points on the transformed playback image which have  
5 appropriate values for matching the sub-image; and  
filtering hypotheses on the playback image which are more than a selected  
distance from any one of the subset of points.

9. The article of claim 8, wherein instructions to transform the recorded image  
and the corresponding playback image comprise instructions to change color values of  
10 pixels in the images into at least one of black and white pixels.

10. The article of claim 8, wherein the object comprises a non-textual object.

11. The article of claim 8, wherein the filtered hypotheses are incorrect  
hypotheses for the active object.

12. The article of claim 8, wherein a hypothesis comprises a contour of an object  
15 on the playback image which corresponds to a contour of an object on the recorded  
image.

13. The article of claim 8, wherein instructions to filter hypotheses comprise  
instructions to reject a hypothesis if the contour of the hypothesis does not have an  
intersection with any rectangle having a top left corner at a point of the subset of points  
20 and a predetermined width and height.

14. The article of claim 8, wherein instructions to filter hypotheses comprise  
instructions to reject a hypothesis if the distance between one of points in the subset of  
points and a contour of the hypothesis is greater than a predetermined distance.

15. A cognitive control framework system for automatically controlling execution  
25 of an application program having a graphical user interface comprising:

a recording component adapted to capture user input data and images displayed  
by the graphical user interface during a recording phase of execution of the application  
program, and to analyze the captured user input data and displayed images to generate an  
execution scenario during the recording phase; and

30 a playback component adapted to perform image analysis on images displayed by  
the graphical user interface as a result of processing the simulated user input data during  
the playback phase and captured displayed images from the recording phase, the  
playback component being adapted to reduce the number of hypotheses for the location

of an active object in a recorded image generated by the graphical user interface by

transforming the recorded image and a corresponding playback image;

determining a sub-image from the transformed recorded image which corresponds to an object to be searched for in the transformed playback image;

5 determining a set of points on the transformed playback image which have appropriate values for matching the sub-image; and

filtering hypotheses on the playback image which are more than a selected distance from any one of the subset of points.

16. The system of claim 15, wherein transforming the recorded image and the  
10 corresponding playback image comprises changing color values of pixels in the images into at least one of black and white pixels.

17. The system of claim 15, wherein the object comprises a non-textual object.

18. The system of claim 15, wherein the filtered hypotheses are incorrect hypotheses for the active object.

15 19. The system of claim 15, wherein a hypothesis comprises a contour of an object on the playback image which corresponds to a contour of an object on the recorded image.

20. The system of claim 15, wherein filtering hypotheses comprises rejecting a hypothesis if the contour of the hypothesis does not have an intersection with any  
20 rectangle having a top left corner at a point of the subset of points and a predetermined width and height.

21. The method of claim 15, wherein filtering hypotheses comprises rejecting a hypothesis if the distance between one of points in the subset of points and a contour of the hypothesis is greater than a predetermined distance.
